MZ EXE Format
Intel byte order

Information from File Format List 2.0 by Max Maischein.

--------!-CONTACT_INFO---------------------
If you notice any mistakes or omissions, please let me know! It is only
with YOUR help that the list can continue to grow. Please send
all changes to me rather than distributing a modified version of the list.

This file has been authored in the style of the INTERxxy.* file list
by Ralf Brown, and uses almost the same format.

Please read the file FILEFMTS.1ST before asking me any questions. You may find
that they have already been addressed.

        Max Maischein

--------!-DISCLAIMER-----------------------
DISCLAIMER: THIS MATERIAL IS PROVIDED "AS IS". I verify the information
contained in this list to the best of my ability, but I cannot be held
responsible for any problems caused by use or misuse of the information,
especially for those file formats foreign to the PC, like AMIGA or SUN file
formats. If an information it is marked "guesswork" or undocumented, you
should check it carefully to make sure your program will not break with
an unexpected value (and please let me know whether or not it works
the same way).

Information marked with "???" is known to be incomplete or guesswork.

Some file formats were not released by their creators, others are regarded
as proprietary, which means that if your programs deal with them, you might
be looking for trouble. I don't care about this.

The old EXE files are the EXE files executed directly by MS-DOS. They were a
major improvement over the old 64K COM files, since EXE files can span multiple
segments. An EXE file consists of three different parts, the header, the
relocation table and the binary code.
The header is expanded by a lot of programs to store their copyright information
in the executable, some extensions are documented below.
The format of the header is as follows :

OFFSET	Count TYPE	Description
0000h	2 char	ID='MZ'
		ID='ZM'
0002h	1 word	Number of bytes in last 512-byte page of executable
0004h	1 word	Total number of 512-byte pages in executable (including the last page)
0006h	1 word	Number of relocation entries
0008h	1 word	Header size in paragraphs
000Ah	1 word	Minimum paragraphs of memory allocated in addition to the code size
000Ch	1 word	Maximum number of paragraphs allocated in addition to the code size
000Eh	1 word	Initial SS relative to start of executable
0010h	1 word	Initial SP
0012h	1 word	Checksum (or 0) of executable
0014h	1 dword	CS:IP relative to start of executable (entry point)
0018h	1 word	Offset of relocation table; 40h for new-(NE,LE,LX,W3,PE etc.) executable
001Ah	1 word	Overlay number (0h = main program)

Following are the header expansions by some other prorams like TLink, LZExe and
other linkers, encryptors and compressors; all offsets are relative to the start
of the whole header :

---new executable

```
OFFSET               Count TYPE   Description
001Ch                     4 byte   ????
0020h                     1 word   Behaviour bits ??
0022h                    26 byte   reserved (0)
003Ch                     1 dword  Offset of new executable header from start of
                                   file (or 0 if plain MZ executable)

---Borland TLINK
OFFSET               Count TYPE   Description
001Ch                     2 byte   ?? (apparently always 01h 00h)
001Eh                     1 byte   ID=0FBh
001Fh                     1 byte   TLink version, major in high nybble
0020h                     2 byte   ??

---old ARJ self-extracting archive
OFFSET               Count TYPE   Description
001Ch                     4 char   ID='RJSX' (older versions)
                                   new signature is 'aRJsf'" in the first 1000
                                   bytes of the file)
---LZEXE compressed executable
OFFSET               Count TYPE   Description
001Ch                     2 char   ID='LZ'
001Eh                     2 char   Version number :
                                    '09' – LZExe 0.90
                                    '91' – LZExe 0.91
---PKLITE compressed executable
OFFSET               Count TYPE   Description
001Ch                     1 byte   Minor version number
001Dh                     1 byte   Bit mapped :
                                   0-3 – major version
                                     4 – Extra compression
                                     5 – Multi-segment file
001Eh                     6 char   ID='PKLITE'
---LHarc 1.x self-extracting archive
OFFSET               Count TYPE   Description
001Ch                     4 byte   unused???
0020h                     3 byte   Jump to start of extraction code
0023h                     2 byte   ???
0025h                    12 char   ID='LHarc's SFX '
--LHA 2.x self-extracting archive
OFFSET               Count TYPE   Description
001Ch                     8 byte   ???
0024h                    10 char   ID='LHa's SFX '
                                   For version 2.10
                                   ID='LHA's SFX ' (v2.13)
                                   For version 2.13
---LH self-extracting archive
OFFSET               Count TYPE   Description
001Ch                     8 byte   ???
0024h                     8 byte   ID='LH's SFX '
---TopSpeed C 3.0 CRUNCH compressed file
OFFSET               Count TYPE   Description
001Ch                     1 dword  ID=018A0001h
0020h                     1 word   ID=1565h
---PKARC 3.5 self-extracting archive
OFFSET               Count TYPE   Description
001Ch                     1 dword  ID=00020001h
0020h                     1 word   ID=0700h
---BSA (Soviet archiver) self-extracting archive
OFFSET               Count TYPE   Description
001Ch                     1 word   ID=000Fh
001Eh                     1 byte   ID=A7h
---LARC self-extracting archive
OFFSET               Count TYPE   Description
001Ch                     4 byte   ???
0020h                    11 byte   ID='SFX by LARC '

After the header, there follow the relocation items, which are used to span
multpile segments. The relocation items have the following format :
OFFSET               Count TYPE   Description
0000h                     1 word   Offset within segment
0002h                     1 word   Segment of relocation
To get the position of the relocation within the file, you have to compute the
```

physical adress from the segment:offset pair, which is done by multiplying the segment by 16 and adding the offset and then adding the offset of the binary start. Note that the raw binary code starts on a paragraph boundary within the executable file. All segments are relative to the start of the executable in memory, and this value must be added to every segment if relocation is done manually.
